MEDICATION-SAFETY HANDOFF

Inpatient pharmacy handoff to the discharging reviewer | Status: Signed

FROM: Ezekiel Marlott, PharmD, BCPS — Inpatient Pharmacy

RE: Discharge medication planning, Korvin Merrow

Quick pharmacy handoff ahead of tomorrow's planned discharge (05/24) so the reconciliation can be finalized today.

Antibiotic: he is on cefpodoxime as the inpatient oral step-down. For discharge I would switch to nitrofurantoin 100 mg by mouth twice daily to finish a seven-day course. It is our formulary-preferred oral agent for urinary coverage and keeps the outpatient script simple.

Cardiac: creatinine and potassium are back to baseline, so I would resume sacubitril/valsartan at his home dose of 24/26 mg twice daily starting at discharge.

Steroid: his home prednisone is confirmed at 5 mg daily per the most recent fill, so I would write prednisone 5 mg daily at discharge.

Aspirin and atorvastatin continue unchanged, and carvedilol can stay on the current cautious schedule. For his low-sodium cardiac diet, a potassium-based salt substitute is a reasonable swap to help with blood pressure and meal palatability at home.

Pharmacy is available to co-sign the final reconciliation.
