HEARING SCREENING AND FOLLOW-UP RECORD

Patient: Marcus D. Whitfield **MRN:** PED-2025-04471

DOB: 03/03/2016 **Compiled Record Date:** 03/2022

NEWBORN HEARING SCREEN — ~2016

Test: OAE (Otoacoustic Emissions) **Result:** REFER (bilateral)

Recommendation: Follow-up diagnostic ABR within 3 months per JCIH guidelines.

AGE 3 FOLLOW-UP — ~2019

Test: Behavioral audiometry (conditioned play audiometry) attempted.

Result: Non-confirmatory. Testing could not be completed due to patient noncompliance and behavioral dysregulation. The audiologist noted that Marcus was unable to be conditioned to the play audiometry task and became agitated during testing. Results are considered unreliable.

Recommendation: Repeat testing recommended when behavioral compliance can be achieved. Consider sedated ABR if behavioral testing remains non-confirmatory.

AUDIOLOGIC STATUS SUMMARY

Newborn hearing screen: REFER. Follow-up at age 3: non-confirmatory (behavioral). No further audiologic evaluation on record. The 'refer' result on newborn screening has not been resolved with a confirmatory diagnostic evaluation. FASD is associated with auditory processing difficulties and sensorineural hearing loss. A formal audiologic evaluation (ABR or behavioral audiometry with appropriate developmental accommodations) is recommended.
