DENTAL CONSULTATION NOTE

Patient: Marcus D. Whitfield MRN: PED-2025-04471

DOB: 03/03/2016 Age: 10 years Sex: Male

Date of Visit: 03/14/2026

Reason: First dental examination — new patient (40 days post-foster placement)

Accompanied By: Ms. Renee Carter (foster parent)

Provider: Sara Kim, DDS — Pediatric Dentistry

DENTAL HISTORY

No prior dental records available. Ms. Carter states this is the first dental visit she is aware of since Marcus came into her care on 02/04/2026. No documentation of prior dental examinations found across four foster placements. Patient is cooperative but anxious during examination, requiring extended verbal preparation and sensory accommodation (dimmed overhead light, noise-canceling headphones per caregiver request).

MEDICAL HISTORY RELEVANT TO DENTAL CARE

ASD Level 2, ADHD, PTSD, FASD, severe asthma (4 intubations), suspected Crohn's disease, pica with elevated blood lead (21 mcg/dL), NF1. Current medications: risperidone 1.5 mg QHS, methylphenidate ER 27 mg QAM, clonidine 0.1 mg QHS, budesonide/formoterol 160/4.5 mcg inhaler BID, albuterol MDI PRN, montelukast 5 mg QHS, ferrous sulfate 325 mg daily, melatonin 3 mg QHS, PEG 3350 17 g daily. NKDA.

EXAMINATION

Extraoral: Symmetric face, no swelling, no lymphadenopathy. TMJ: no clicking or deviation on opening.

Intraoral: Mixed dentition. Generalized enamel hypoplasia noted on primary and permanent teeth — pitting pattern, particularly on maxillary incisors and first permanent molars. Four cavities identified: #3 (occlusal), #14 (occlusal), #19 (mesial-occlusal), #30 (occlusal). Gingival inflammation noted — marginal gingivitis, generalized, mild-to-moderate. Bleeding on probing at multiple sites. Soft tissues otherwise unremarkable. No oral ulcerations.

ASSESSMENT

1. Four carious lesions requiring restoration.
2. Generalized enamel hypoplasia — pattern consistent with developmental etiology.
3. Marginal gingivitis — multifactorial: poor oral hygiene access across placements, ferrous sulfate staining contributing to plaque visualization difficulty.

PLAN

- Restorations scheduled for 4 carious lesions (2 appointments). Caregiver aware that sensory accommodations and possible nitrous oxide sedation may be needed given ASD and anxiety.
- Oral hygiene instruction provided to caregiver. Electric toothbrush recommended for improved plaque removal given motor and sensory considerations.
- Fluoride varnish applied today.
- Follow-up in 3 months for restorations and cleaning.
