CARDIOLOGY ADDENDUM

Patient: Harold J. Pemberton | MRN: 847-29-3156
Date: 02/27/2026 10:00 | Provider: Dr. A. Kim, Cardiology

Per IR clearance (Dr. Alvarez, 02/27/2026), patient has completed the 5-day post-embolization anticoagulation hold.

RECOMMENDATION: Restart apixaban 5 mg PO BID today.

CHA2DS2-VASc score: 5 (CHF, HTN, DM, age 65-74, vascular disease). Annual stroke risk approximately 6.7% without anticoagulation. Bleeding risk must be balanced, but with confirmed durable hemostasis post-embolization, the stroke risk substantially outweighs the re-bleeding risk.

Heart failure clinic follow-up in 2 weeks for GDMT optimization. Will plan to uptitrate carvedilol (currently 12.5 mg BID, target 25 mg BID) and reassess spironolactone at that visit pending renal function.
